

South Brent Bird Survey 10-year Anniversary

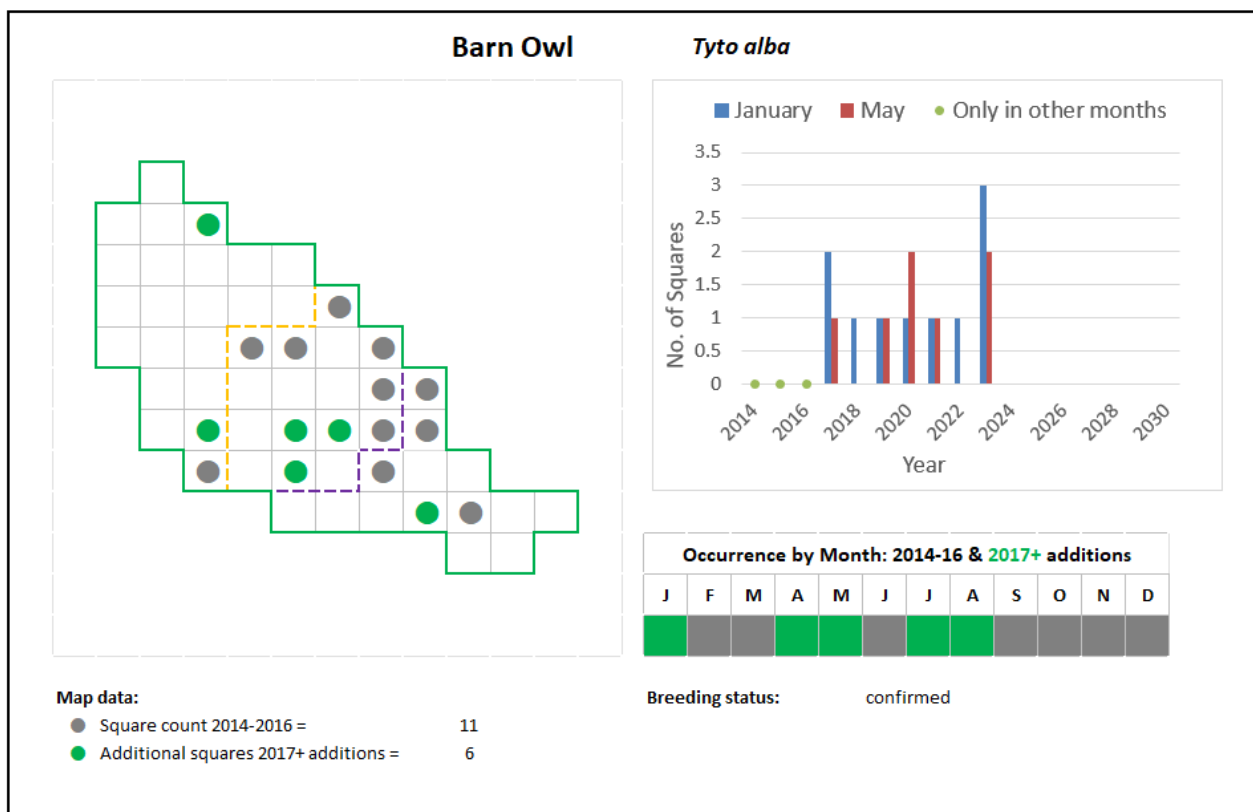

How many bird species have been recorded? And where have they been seen in the parish? Which have bred in South Brent? In which months of the year were they present?

Read on for the definitive answers to these and other questions.

The South Brent Parish Bird Survey began in 2014, and for the first three years each 1-km square (monad) comprising the parish was visited at least once every month by an experienced birder. The results were published in 2018 in *The Birds of South Brent Parish*. Since then, the survey has continued, mainly in the form of January and May surveys to cover the winter and breeding periods. Again, all squares were visited during each of these annual surveys. In addition, for other months, casual records have continued to add to our knowledge of the South Brent avifauna.

While the aim of this document is primarily to show the results from the first decade of the survey, a small number of 2024 records have been included – ie from the 11th year. These will be expanded over time to show our second decade survey results.

The following pages list 143 bird species¹ which have been recorded in the parish since 2014, and provide up-to-date information on distribution, annual changes, seasonal occurrence and breeding status. The information is explained in the example below.

Map. The map shows the 52 1-km squares comprising the South Brent Parish area. Yellow and purple lines separate the Central Zone from the North (moorland) and South (south of the A38 and outside the Dartmoor National Park) Zones, respectively. Grey blobs indicate known occurrence during 2014-16, and green blobs reflect occurrence in any additional squares in 2017 or later.

Breeding Status. Using BTO codes, and based on appropriate evidence, these indicate whether the species is, or has been, either a confirmed, probable or possible breeder since 2014. 'none recorded' indicates a lack of evidence for breeding.

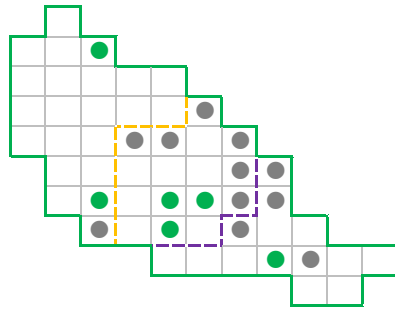

Bar-chart. This shows the number of squares in which the species was recorded in January (blue bar) and May (orange bar) each year since 2014. Green blobs on the x-axis show that the species was recorded only in months other than January and May in the given year.

Box. This shows monthly occurrence. Grey infill shows occurrence during 2014-16, and green shows occurrence in any additional months from 2017 onwards.

¹ We have said 143 species for convenience. In fact there are 141 true species plus the 'Italian' Sparrow subspecies and the aggregate term 'Harrier sp.
